The most obvious feature that could be added is a simple batch-function for performing adjustments to all of the images in the folder. This is probably not the most useful feature, however, as photographers generally need to make consistent settings to images in a series. However, Lightroom may be the first program to offer such a feature, but it probably won't be the last. If you feel you can manage without these two major features, then you're probably pretty happy with Lightroom 5. Personally, I have little use for them. Is there anything in Lightroom 5 that could be improved? Let's take a look at the targeted market that Lightroom 5 was created for. There are several tweaks that could be made to improve the general user experience. The most notable is certainly the "usual suspects" such as dynamic (as in animated) metadata tags. However, there are no plans for any new XMP metadata functionality with Lightroom 5. Sure, it would be easy to add this with a plugin, but Lightroom developers are fully aware that not everyone wants this. Until then, photographers would have to stick to another program to extract and edit the XMP data. That's a bit of a hassle. That might be the reason why Photoshop CS5 had no XMP metadata. Adobe is the king of features, but sometimes it's missing the essentials. Like, for instance, an XMP standard for X-Trans RAW files. All we can do is hope that X-Trans support will be improved in Lightroom 6. Let's take a look at the remaining highlights. The new Lightroom now offers some basic level of hardware acceleration.
